THE YEGA OF NORTHERN PAPUA

131
36
[161]

THE Yega is a group of nearly 900 people living in sixteen settlements, on an area of about twelve square miles, on the north coast of Papua. They live on a gently sloping alluvial plain between Mt Lamington and the sea. Yega territory is bounded by one large stream and crossed by several small creeks.

137

The plain was originally covered by mature rain forest 100-120 feet high, interspersed with elongated strips of grassland. Now, much of the original forest has been cut down, and secondary forest forty to fifty feet high has

132

replaced it. The climate is hot and wet throughout the year (Köppen Af.) but there is marked seasonality of precipitation. The north-west monsoon, November to April, brings two-thirds of the annual rainfall (average 100 inches per year); July and August with about four inches per month are relatively dry. The temperature is over 80°F on most days and rarely falls below 70°F on the coolest night, but the heat is alleviated by north-easterly sea breezes which blow during the afternoon and evening throughout the year.

The first reported contact between Europeans and Yega was during an expedition along the coast by the Lt Governor of Papua, Sir William McGregor, in 1893, but the first real step in the process of change occurred with the establishment of an Anglican mission school on Waususu Point in 1909. From this time until the outbreak of World War II, Yega men began leaving their villages to work
